

Yasen Dimitrov

y_dimitrov@ymail.com | +359 882 392 556 | Sofia, Bulgaria | [GitHub](#) | [Portfolio](#)

Backend engineer building large-scale, service-oriented systems - owning features from architecture through production and working AI-natively with full ownership of quality and security. Production experience across Python microservices, REST/GraphQL APIs, containerized AWS workers, and billion-row data platforms; deepening in Rust and C for systems work.

Skills

Languages: Python, Rust, TypeScript, JavaScript, SQL, C

Technologies: React, GraphQL, FastAPI, Snowflake, AWS, Linux, Terraform, CI/CD, REST APIs, Docker, Claude Code

Work Experience

Software Engineer, DataArt – Sofia, Bulgaria Feb 2026 – Present

- Build and maintain FastAPI/SQLAlchemy microservices and containerized SQS-fed AWS Lambdas for a royalty accounting platform processing billions of revenue rows, exposed to a React frontend through REST and a GraphQL aggregation layer
- Own delivery end-to-end via Jenkins CI/CD (Dockerized lint/type/unit stages, real-container Lambda integration tests per PR, blocking vulnerability scanning) and Terraform infrastructure with Checkov and AI review gates; remediated CVEs and right-sized Lambdas from measured memory peaks
- Profiled and resolved Lambda performance issues end-to-end - separating Snowflake query time from Python processing using CloudWatch and Snowflake query history to disprove assumed bottlenecks before changing code, then cut peak memory ~50% by replacing row-by-row pandas operations with vectorized PyArrow processing and streaming zip output to S3
- Develop secure service-to-service APIs with JWT auth middleware, Auth0 M2M tokens backed by AWS Secrets Manager, YAML-driven access rules, Pydantic request validation, and per-request correlation IDs traced through Datadog APM and Sentry

Backend / Full-Stack Software Developer, MClimate – Sofia, Bulgaria Mar 2024 – Dec 2025

- Designed and implemented a Python rules engine evaluating real-time IoT device events (LoRaWAN telemetry) to trigger automations, powering 500+ active rules in production
- Led Meilisearch integration and backend microservice refactors (PHP API, NestJS), deploying a dedicated search service in Docker Swarm and achieving a 10× improvement in search performance
- Led JavaScript-to-TypeScript migration and introduced CI quality gates (pre-commit hooks, commit standards), cutting type-related production defects

Technical Consultant, FactSet – Sofia, Bulgaria May 2022 – Mar 2024

- Wrote and optimized complex SQL over large-scale financial datasets, cutting query times for data deliveries
- Built and maintained ETL workflows delivering financial data to clients, focused on data correctness

Education

University of Helsinki, Finland – Full Stack Software Development June 2023

University of Catolica, Portugal – Master in International Business Law July 2015

University of Manchester, UK – Bachelor of Law June 2013
